Hi Bob v,

Made a press to remove knobs which I have had success with.

Largest removed so far is a 6/0, only had one break and that was a smaller one.

I always put the handle in the freezer for 24 hours before trying to remove the knob.

It was made out of some scrap aluminium I had, would be better made from steel plate as the aluminium flexes somewhat, and the design could do with a bit of modifying, which I will get around to sometime.

It is not precision engineering, but I am a carpenter 🙄

Also, if you put the plate in front of the removed knob, you can use it as a press to put the knob back onto a new arm.

Mike.
